

Lagrangian dispersion of light solid particle
in a high Re number turbulence;
LES with stochastic process at sub-grid scales

Measurements of Lagrangian statistics of light particle in the high Re turbulence

(from Mordant and Pinton, ENS of Lyon, 2001, 2004)

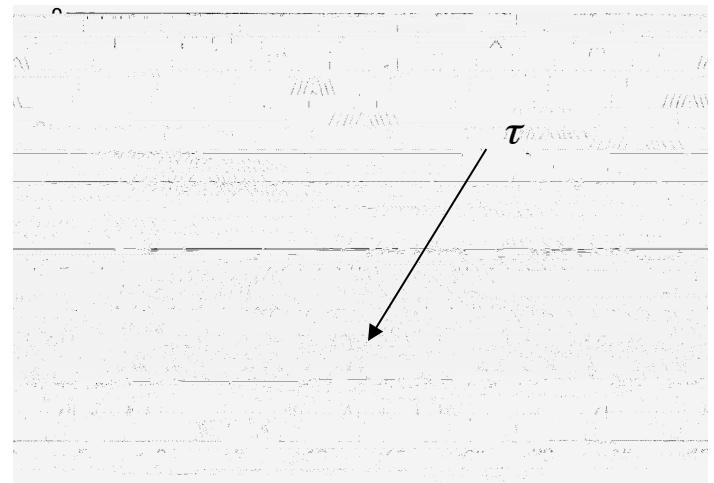

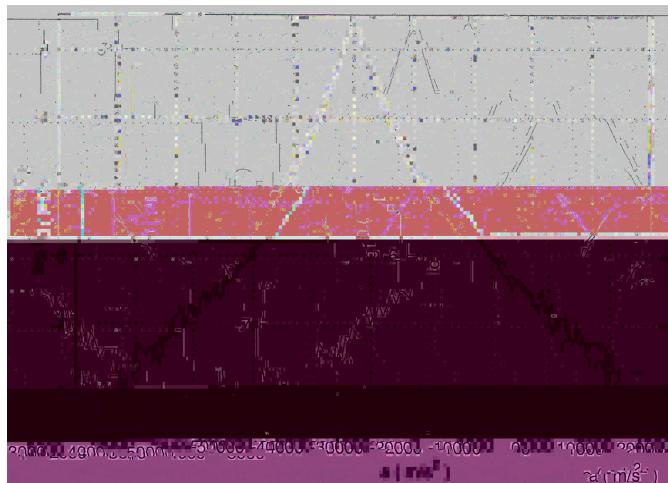

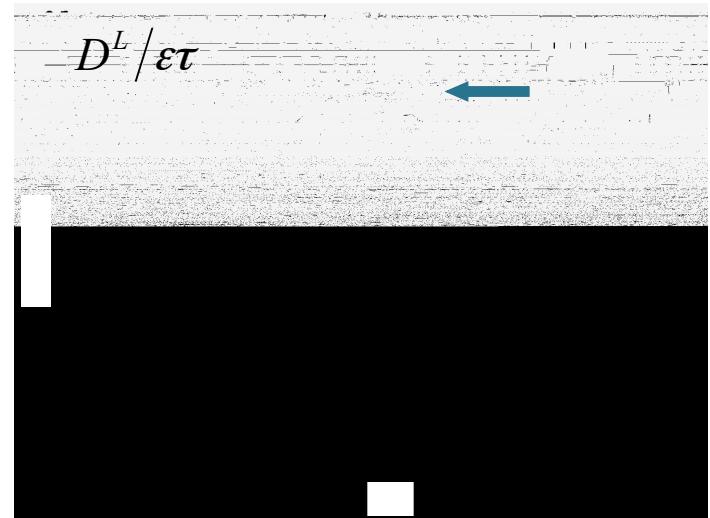

$$\text{Re}_L = 740$$

$$= 14$$

$$= ms$$

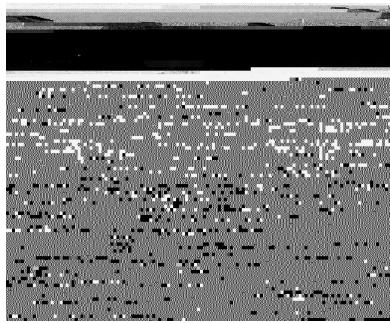

$$\langle \cdot \rangle / \langle \cdot \rangle = 1,06$$

$$d_p = 250$$

In Diesels: Re

Our objective

Log-brownian stochastic process with constant force

!

$$= \ln(\alpha)$$

$$\dot{\alpha} = -\langle \dot{\alpha} \rangle - \frac{1}{2} \langle \ddot{\alpha} \rangle$$

!

$$\langle \dot{\alpha} \rangle / \langle \alpha \rangle = \left(\frac{1}{l} \right) l$$

!

$$\dot{\alpha} = \frac{\langle \ln \alpha \rangle}{l} + \sqrt{\frac{\langle \ln^2 \alpha \rangle}{2}}$$

!

$$= +$$

!

$$\frac{dV_p}{dt} = \frac{U_{local}}{Stokes} V_p$$
